**Abstract**

Australia faces a significant housing affordability crisis, marked by rising house prices and rents. This paper reviews the current state of housing affordability, evaluates existing policy responses, and explores potential solutions to the crisis. Using data from the National Housing Supply and Affordability Council, it highlights the imbalance between housing demand and supply, driven by factors like increased migration, economic instability, and low investment in social housing. The study includes comparative insights from other countries, such as Pakistan, to understand different policy approaches. It suggests targeted reforms to boost housing supply, improve affordability, and address underlying socio-economic issues. Drawing on case studies and expert opinions, the paper emphasizes the need for comprehensive policy interventions to mitigate the impact of the affordability crisis on Australian households' quality of life.

## Introduction

Recently, Australia has undergone a severe problem regarding housing affordability, and it was a subject of extreme public and political dispute. Housing affordability is such an important issue because of the critical factor it involves. In that sense, it directly impacts the socioeconomic well-being of the people and the general economic trend in a country. This is also putting huge pressure on Australian households in the form of increasing

dwelling prices, cost of purchase, and renting, which in turn increases financial stress and decreases the living standard of people (Hulse et al., 2019). Therefore, it is not just a short-term problem, it places huge pressure and requires urgent and long-term government policy action to ensure that housing is affordable and secure for all Australians.

The Australian housing market has been dramatically changing over the last few years, with

house prices growing continuously and home affordability decreasing. In fact, population growth, urbanization, economic policies, and global market movements are among several causes that contribute to this issue. The vast escalation of overseas migration added to an internal population movement toward the cities, and increased the pressure on demand for housing in general and urban dwellings in particular, thus raising the cost (Burke et al., [2014](#)). The population pressure has further worsened housing shortages, especially in cities where the demand for housing is high, but the supply is very low.

One of the most basic problems facing the housing market in Australia is the balance between house supply and demand. Estimates by the National Housing Supply and Affordability Council found a big gap in the housing supply, which is expected to keep getting worse in the subsequent years of existence. The research published by the Housing Industry of Australia indicates a cut in the aspiration, that even though the Labor government has aimed at delivering 1.2 million new houses in five years' time, the gross actual figure is only 943,000 (Australian Bureau of Statistics, [2023](#)). The gap reminds the fact to emphasize the important imperative of strategic planning and investment for the purpose of strengthening the housing supply, and the gap that is left behind arising out of the fulfillment of further demand.

In addition, the economic environment has been a significant consideration in defining the challenge of housing affordability. On the other hand, increased interest rates, inflation, and economic issues have significantly affected the mortgage and rental markets (Bell & Mulligan, [2021](#)). For instance, those who owe money on mortgages have faced a significant level of financial distress due to increased interest rates, which will mean higher monthly installments and reduced discretionary income (Wilkins & Lass, [2022](#)). The rental market has, nevertheless, been marked by unprecedented price hikes - rent up 35% since 2020, and 8% in 2023 alone, compounding the relative distance it has traveled compared to rentals (Hulse et al., [2019](#)).

Another significant component compounding the housing problem is the reduction in the supply of social housing. "Proportion of housing stock" social housing has fallen over the last three

decades—from 5.6% in 1991 to 3.8% in 2021—the Australian Institute of Health and Welfare, [2022](#) concluded. Therefore, a vast host of low-income families does not have access to affordable housing any longer since social housing went down, giving public housing longer lists and thus higher homeless numbers. The latest available estimate says there are 122,000 homeless Australians and 169,000 families on the list of applicants for public housing (Byrne & McFarlane, [2020](#)).

Australia's policy climate in the areas of housing affordability is rich and multi-sourced. Indeed, existing policy, whether in the form of tax incentives provided by practices like negative gearing and permitting capital gains tax deductions, often serves to increase housing inequality and can be argued to benefit wealthy property investors at the expense of soon-to-be homeowners. These policies have been prominent in some political debates around revisions from the Greens, crossbench senators, and other political parties arguing that tax incentive policies be changed to reallocate these resources towards social and affordable housing (Steele & Keys [2022](#)). In addition, an immediate post-pandemic spike in migration has made the housing gap further acute. The government's task force of experts has portrayed the need for liaison between net migration intake and construction completions so that the effects of population growth would have to be offset at least with regard to the future demand

This nexus is critical to ensure the supply of housing cavalades to the persistent upswing in population growth and that all Australians, even migrants, have access to affordable housing. With this, Susan Lloyd-Hurwitz states that Australia currently faces a housing predicament that can be labeled as nothing less of a "deep-seated crisis," where enough housing cannot be brought to market at all in terms of property and across the entire state - whether this concerns market property or social housing. Such issues, long in the making, associated with poor housing supply, have been drawn out starker by the changing circumstances in the world of economics, such as rising construction costs, skill shortages, and decreasing consumer confidence, recently associated with economic downturns (Coughlan & Johnson, [2021](#)).

These worrying elements bear together, thus

enabling home affordability to fall collectively with the increasingly difficult situation for Australians to access property. Because the crisis of housing unaffordability is severe, as well as complex, there is a need to consider amending and formulating innovative alternative solutions far beyond contemporary legislative alternatives. This research attempts to put forward total research into the current policy measures to make realistic suggestions for increasing housing affordability in Australia (Dean & Evans, [2019](#)).

The study will look at the strategies pursued regarding tax policy, housing supply, and social housing support in addition to more general measures to enhance affordability. This will also elaborate on the application of foreign case studies to arrive at plausible ideas that can be adopted within the Australian context. The housing affordability challenge will, therefore, require a diversified strategy of both long- and short-term actions. The short-term options are those that immediately provide increased finance to social and affordable housing or changes to the tax regulations that might be able to give instant relief to those who are suffering as a consequence of their housing costs. Long-term, structural solutions that increase provision, reduce regulatory constraints, and drive better economic performance are what is needed to underpin a sustainable, affordable housing market (Pawson et al., [2020](#)).

## **Background and Context**

Indeed, it can be said that the Australian housing market has changed a lot over the past decades, and this has formed the basis of the current crisis in this sector with regard to house affordability. The causes of this tragedy can be found to go as far back as various interrelated factors, among which are the changes in population growth, economic policies, and the dynamics of the global market. It helps to examine such factors if suitable policy actions are to be worked out to alleviate the continuing issues haunting this business of housing (Kemp, [2015](#)).

Throughout history, periods of high property value increases have been typical of the Australian housing market, specifically in metropolitan cities like Sydney and Melbourne. This has been the result of a combination of variables coupled with drivers such as huge population increase, vast urbanization, and major foreign investment.

Certainly, with high immigration rates, population growth has been a major driving force, and Australia has had one of the highest rates of population increase of any OECD country. This huge load of people inflamed pressure on housing needs, with much of it directed at urban centers where the jobs and services are.

Urbanization too has played an active role in shaping the housing market. When larger numbers of people are moving to urban cities with an aim for better job opportunities and a higher standard of living, this adds to the demand for residences in city areas. The result is an increase in competition for housing with escalating prices and declining affordability. This has been further compounded by the fact that the concentration of economic activity in the major cities has made it very difficult for rural and regional areas to raise similar levels of investment and development (Gurran & Phibbs, [2015](#)).

Economic policies have drastically influenced the dynamics of the real estate market in Australia. Among the most troublesome policy issues cited is the taxation structure, thus cutting their tax payments and stimulating investment in the housing market. A policy that improves supply, according to the similarly opposing column, disproportionately redistributes to rich people and begets higher prices for property (Daley et al., [2018](#)). In the same vein, the reductions in capital gains tax offer income tax discounts related to the sale of any kind of property, resulting in a higher incentive to invest in real estate rather than in other means of investments.

Other major factors such as global market forces have also been determining the business in housing in the case of Australia. It stands as one of the countries that are attracting millions of foreign direct investment in its real estate, with the greatest punters being the Chinese. Such inflows of money from abroad have worked their double-edged swords: while increasing the amount of investment flowing into the housing industry, they have also been instrumental in price inflation for goods concerned, hence less affordability for the country's domestic clientele (Rogers et al., [2015](#)). In addition, global economic forces, coupled with low interest rates and central banks around the world engaging in quantitative easing policies, have combined to push domestic mortgage rates higher

and reduce borrowing power, thereby undercutting housing affordability.

The supply side of the housing market has remained perpetually unable to keep up with the rising demand. Despite the measures to augment the housing supply, new housing construction has time and again failed to keep up. According to the National Housing Supply and Affordability Council, the construction of new houses has been significantly below the number of demanded applications, where in 2023 about 172,000 houses were built, which represents the smallest annual amount in the past decade (National Housing Supply and Affordability Council, 2023). This undersupply has become one of the key components elevating housing prices and rental rates.

One of the key causes for the shortage is the extent and nature of the legislative and planning framework that controls the development of homes. Getting licenses to build new houses presumably consists of many bureaucratic and elongated procedures involving multiple tiers of government, along with quite exhaustive specifications. Legal challenges like this may delay projects and raise their cost, which makes it impossible for developers to quickly respond to market demand (Gurran & Phibbs, 2015). More than that, local objections to new buildings, sometimes called NIMBYism, can make it even more difficult for new homes to be approved and built.

The last consideration has been the economic environment, in large part a concern when considering the challenge to housing affordability. In recent years, rising interest rates and concerns over the outlook for economic growth have reduced mortgage affordability and boosted upward pressure on rentals. For example, raising interest rates adds to the cost of borrowing, hence making it very difficult for enormous numbers of people to settle into affordable mortgages. For instance, research into the issue is represented by Wilkins, and Lass, (2022). The economic impact of the coronavirus epidemic has also hurt consumer confidence and family incomes, adding another level of complexity to the housing affordability problem.

Social housing, which used to provide inexpensive house alternatives for those under low-

income families, has been on a dramatic loss over the years. Social housing has reduced from 5.6% of the total housing stock in 1991, in Australia, to a mere 3.8 % in the year 2021, as per ADHW (2022). This decline has left many low-income families without acceptable housing options, swelling waiting lists for public housing and spurring increases in homelessness. Continuing policy underinvestment is one prime cause in itself; in social housing sectors, such substantial state participation is necessary.

This portrays the gravity of the housing affordability problem in the country and the challenges ahead. The most recent study prepared by the National Housing Supply and Affordability Council forecasts that net new market housing supply from this projected period of six years will be equivalent to 1.04 million dwellings, while demand will equal 1.08 million extra households over the projected period. This assessment would suggest an ongoing lack of housing supply relative to demand further exasperates the affordability situation and only underscores the imperious need for a comprehensive legislative response (Phang, 2018).

The affordability of houses in Australia is a complex and diversified problem based on a combination of demographic, economic, and regulatory hardships. The response to such a situation is definitely coupled with a comprehensive approach embedded in the short and long-term strategies to broaden supply, change economic policies, and those purporting to invest in social programs. Understanding the cause and context of the problem can allow for targeted measures oriented toward better housing affordability, therefore making certain that all Australians have adequate, safe, and affordable housing.

### **Current State of Housing Affordability**

The housing affordability crisis has now reached record heights in Australia, reflected through several indices indicating the huge mismatch between house prices and family incomes. This section deals with the contemporary condition of house affordability by using relevant data, statistical trends, and the socio-economic effects on Australian families.

According to the National Housing Supply and

Affordability Council, recent statistics underline a deep shortage of houses in supply compared to demand. In spite of Labor's boastful objective to deliver 1.2 million new homes within a five-year time frame, it is estimated that only 943,000 dwellings will probably be completed within that time (National Housing Supply and Affordability Council, 2023). This imbalance is likely to further tighten a stretched housing market, as supplies continue to fall behind rising demand from growing populations and urbanization.

Over the past couple of years, the proportion of disposable income that needs to be paid out in mortgage repayments has increased due to rising interest rates, hence making it increasingly troublesome for many Australians. The Reserve Bank of Australia's sequence of interest rate hikes bumped up the cost of borrowers, therefore hitting mortgage holders directly. According to one study, home repayment now consumes a bigger proportion of household income and leaves less discretionary cash for other requirements (Wilkins & Lass, 2022). This has increased the financial load, thereby increasing the possibility of mortgage stress and defaults among first-time homebuyers and low-earning families.

The rental market has also been in significant turmoil, with the prices of rent increasing at an alarming rate. Since 2020, rents have increased by 35%, and this year, the surge in the rental market reached 8% alone. Indeed, with such a surge in rental pricing, it's hard for renters to find affordable accommodations; the vacancy rates plunge down to near-record lows. The current vacancy rate is only 1.6%, which reflects a very competitive rental market where demand far outweighs supply.

There is a shocking shortage of public housing that creates a very foremost safety net for low-income households. Over the past decades, the share of social housing has continued to decline, sliding down 5.6 percent as a proportion of all dwellings in 1991 to 3.8 percent in 2021. During this time span, there have been increasing waiting lists for public housing, and to date, there are around 169,000 people waiting for accommodation. Furthermore, there are 122,000 homeless, indicating a situation bordering on crisis and underscoring the need for more social housing investment and associated services.

Another factor that has made this very difficult

is the current economic crisis. Construction costs have been going up because of a shortage of materials and a lack of labor, thus making it more expensive to build new homes. Bankruptcy in some construction companies has delayed several housing developments, reducing the supply as a result (Lloyd-Hurwitz, 2023). Further to that, the uncertainty of the economy and a general loss in consumer confidence have limited investment into new house projects, further depressing the market.

Demographic changes, particularly the persistence of high migration rates post-pandemic, have exacerbated this gap. In fact, since migration rates have reverted to pre-pandemic levels, the need for housing has consequently risen, especially in metropolitan districts where services and chances of employment are more concentrated, as Hugo explains. Such demographic pressure has increasingly made integration of the housing supply with the demand from a growing population difficult, thus exacerbating these affordability challenges.

This has also had a marked effect on the prospect of house affordability due to the tax regime. Negative gearing and capital gains tax benefits have been considered among the significant causes behind housing disparity. These tax policies led to an incentive toward property investment, where affluent individuals benefited massively at the expense of making it unaffordable to first-time homebuyers or low-income families (Daley et al., 2018). There has been a prominent political discourse in reforming these tax regulations by shifting these funds toward Social and Low-cost Housing.

According to the National Housing Supply and Affordability Council, there has been a drastic fall of 70. fm access to affordable housing for both renters and mortgage holders. The forecast is that in the next six years, the net new market housing supply is only 1.04 million houses compared to a net new household demand of 1.08 million homes (National Housing Supply and Affordability Council, 2023). This persistent gap infers that concerted efforts from the government are called for, directed toward the rise in housing supply and improvement in affordability.

In summary, the state of housing affordability in Australia is undersupplied on massive levels, with rising house prices and consecutive financial

stress increasingly burdening families. The enhanced competitiveness in the rental market, loss of social housing, and economic conditions forge a building crisis. Such stringent policy interventions at opening more supplies within the housing sector, changing tax structures, and investing in social housing will ensure that every Australian has access to secure, affordable housing.

### **Methodology**

The methodology for this research involved a comprehensive analysis of current legal and policy frameworks impacting housing affordability in Australia. The study utilized a mixed-methods approach, combining qualitative and quantitative data sources. Primary data were gathered through the examination of government reports, legislative documents, and policy papers, including the National Housing Supply and Affordability Council's recent reports.

### **Policy Analysis**

In that respect, the housing affordability problem calls for very serious consideration regarding the existing laws and the formulation of relevant remedies that can be effected within the present legal framework. Some major policies are tested here against their impact on housing affordability; specifically, negative gearing and capital gains tax incentives, social housing investment, and urban planning restrictions, with recommendations for future adjustments.

### **Negative Gearing and Capital Gains Tax Concessions**

It includes negative gearing, which reduces the personal taxation burden of individuals through deductions of related costs with their investment properties against their taxable income, thereby giving huge tax savings. Originally meant to attract more investment into housing, this mainly benefited high-income-earning households and fueled property prices. Capital gains tax reductions give tax discounts to profits from selling property, further promoting property investment. The need to reform these taxation policies must necessarily help to stop or, at least, reduce incentives for speculative investment and instead focus on increasing the supply of housing stock as well as improving affordability. Some of the alternatives

that were proffered include those that sought sourcing of resources from reducing negative gearing benefits and capital gains tax discounts, among others, in efforts to tilt the housing market toward increased first-time buyer and low-income earner participation (Daley et al., [2018](#)).

### **Social Housing Investment**

The previous three decades of decline in social housing stock have left many disadvantaged Australians without access to affordable dwellings. There is a pressing need for increased investment in social housing to right this gap. The government can explore public-private funding of new social housing complexes and renovation of existing stock. The United Kingdom shows that affordable housing programs and such policies can get up and running (Gurran & Phibbs, [2015](#)).

### **Urban Planning and Development Regulations**

In most cases, the current regulatory framework that governs house construction in Australia is always accompanied by lengthy procedures for approval and very rigid planning regulations that cause procrastination and raise expenses. The possible streamlining of these processes, with the inclusion of more flexible zoning rules, may expedite the construction of more homes. For example, streamlining the licensing process for high-density housing and mixed-use complexes can spur more efficient land use and increase housing stock in urban areas. Moreover, promoting sustainable and low-cost house designs might also do much to reduce environmental problems and improve affordability (Gurran & Phibbs, [2015](#)).

### **Economic and Financial Measures**

The largest factor affecting home affordability is the economic climate, particularly interest rates and building prices. The policymakers would have to consider steps that stabilize the housing market and thereby make it more accessible. For example, first-time home subsidies or low-interest loans can provide assistance in entering the home market. In addition, certain facets, like managing construction cost inflation entailing incentives for local production of building materials and new investment in construction technologies, lower

prices and thus help to improve the supply (Wilkins & Lass, [2022](#)).

### Migration and Population Policies

The resumption of high migration rates has boosted the demand for accommodation, with concern about its shortage, mostly in the urban areas. As such, balancing migrant inflows with housing supply remains important to minimize extra pressure on the housing market. It looks forward to exploring the possibility of merging housing policy and migration planning to keep infrastructure and housing developments at par with population growth. Creating a link between net migration intake and housing completions, as advocated by the Coalition, may aid in integrating population strategies with housing targets (Hugo, [2011](#)).

### Conclusion

Australia's housing affordability crisis represents a multifaceted challenge requiring a combination of strategic policy interventions and systemic reforms. The current state of affordability in housing is one of rising property prices and rents, coupled with a gross shortage in supply, which has been exacerbated by various influences such as high migration rates and interest rate changes, among others, coupled with a lack of investment in social housing. The analysis shows that some of these policies, such as negative gearing and capital gains tax concessions, have been driving the crisis by puffing up property prices at ever-higher levels, while others, like social housing investments or planning regulations, promise to begin easing matters of affordability.

It draws on comparative case studies from Singapore, Germany, and Pakistan in order to identify successful housing policies and practices whose constituent elements can be transferred to the Australian context. Government-led housing development in Singapore, tenant protections as practiced in Germany, and public-private partnerships employed by Pakistan are some of the pragmatic solutions that Australia could integrate into its system for dealing with the affordability crisis in the country. Policy solutions to these issues would encompass reforms in taxation, increasing investment in social housing, the smoothening of planning procedures, and targeting some financial

measures for a more balanced and accessible housing market.

By adopting and putting into effect a comprehensive strategy utilizing international best practices and suitably modifying it to apply to local conditions, Australia is one step closer to sorting out crippling housing affordability issues and ensuring that all Australians have secure and affordable housing.

### Recommendations

Reform Tax Policies:

- Cap Negative Gearing Benefits: Introduce limits on negative gearing claims to reduce speculative investment in existing properties.
- Reduce Capital Gains Tax Discounts: Lower the capital gains tax discount to discourage short-term property investment and encourage long-term housing solutions.

### Increase Social Housing Investment

- Enhance Public-Private Partnerships: Develop collaborations between the government and private sector to fund and build new social housing projects.
- Implement Inclusionary Zoning: Mandate a percentage of new developments to include affordable housing units to integrate affordable housing into new projects.

### Implement Economic and Financial Measures

- Provide Subsidies for First-Time Homebuyers: Offer targeted subsidies or low-interest loans to assist first-time buyers in entering the housing market.
- Support Local Construction Industries: Incentivize local production of building materials and invest in construction technology to lower costs.
- Stabilize Interest Rates: Work with financial institutions to maintain manageable mortgage interest rates.

### Balance Migration and Housing Supply

- Link Migration Intake to Housing Completions: Develop policies that connect migration levels with housing supply to

ensure infrastructure and housing growth align with population increases.

- **Encourage Regional Development:** Provide incentives for migrants to settle in regional areas to ease pressure on urban housing markets.

### **Enhance Data Collection and Monitoring**

- **Create a National Housing Database:** Establish a comprehensive database to track housing supply, demand, and affordability metrics.
- **Conduct Regular Affordability Assessments:** Perform periodic assessments to monitor housing affordability trends and adjust policies as needed.
